

# Path explosion $O(\bar{d}^k)$ from a single anchor node

**Multi-hop error cascading:** each hop has precision  $p \Rightarrow P(\text{path}) = p^k$ .  
 With  $p=0.8$ :  $k=3 \Rightarrow 0.512$  (a coin flip),  $k=4 \Rightarrow 0.41$ . Unconstrained traversal both explodes  $\bar{d}^k$  and decays  $p^k$ .
